Safe-Series – 6150AD Radiation Field Simulation

The new **STS Safe-Series** range brings new technology into handheld simulation to provide the most realistic simulators available today.

A unique radio system produces both a near isotropic field pattern from the source and from the detector. A good representation of the inverse square law and attenuation of different materials adds to the realistic response.

Available now is the **Safe-Series 6150AD** simulator. This Survey meter simulator is a replica of a real 6150AD utilising the **STS Safe-Series** technology.

The simulator features the same display set out, audio output and button arrangements as the real instrument but responds to the **Safe-Series Mini and Pocket Sources**.

All of the instruments in the **Safe-Series** range are compatible – so any combination of Survey Meter, Dosimeter and Source may be used – with up to 16 instruments being simultaneously fielded.
